

Lab 04 [CO3]

Greetings Students. In this lab, we will play with Dummy Headed Doubly Circular Linked List. If you want to read about this type of linked list then check [this file](#).

In this lab, you have to implement a waiting room management system in an emergency ward of a hospital. Your program will serve a patient on a **first-come-first-serve basis**.

Solve the above problem using a **Dummy Headed Doubly Circular Linked List**.

1. You need to have a **Patient** class so that you can create an instance of it (patient) by assigning id(integer), name (String), age (integer), and blood group (String).
2. Write a **WRM** (waiting room management) class that will contain the below methods.
 - a. **RegisterPatient(id, name, age, bloodgroup)**: This method will register a patient into your system. The method will create a Patient type object with the information received as parameter. It means this method will add a patient-type object to your linked list.
 - b. **ServePatient()**: This method calls a patient to provide hospital service to him/her. In this method, you need to ensure to serve the patient first who was registered first.
 - c. **CancelAll()**: This method cancels all appointments of the patients so that the doctor can go to lunch.
 - d. **CanDoctorGoHome()**: This method returns true if no one is waiting, otherwise, returns false.
 - e. **ShowAllPatient()**: This method prints all names of the waiting patients in sequential order. It means the patient who got registered first, will come first, and so on.
 - f. **ReverseTheLine()**: This method reverses the patient line. It means the patient who got registered last, will come first, and so on.
3. Write a **Tester** code that will interact with users and take information about Patients. You will pass this information to **WRM** and create instances of **Patient** in **WRM** and call the methods of **WRM** class. You just need to ensure your Tester code has completed all the properties mentioned in 4 no point.

4. Tester Code Options:

- a. Add Patient – print Success or Not
- b. Serve Patient – print Name of Patient being Served
- c. Show All patients – print all patient in sequence to serve
- d. Can Doctor go Home? – return yes or no
- e. Cancel all Appointment – print Success or Not
- f. ReverseTheLine - print Success or Not

Hints:

Usual Node class design in doubly linked list:

class DoublyNode:

```
def __init__(self, elem, next, prev):  
    self.elem = elem  
    self.next = next # To store the next node's reference.  
    self.prev = prev # To store the previous node's reference.
```

In your program your Patient class will work as the Node class for the Dummy Headed Doubly Circular Linked List and WRM class will work as that Linked List.
